

Table

Multi-functional tables.

This is idea that we had already. I want to make tables in first for myself.

I have not many functions when I work in simple table. I want to have charging, computer, food place, may be diary or something like pack for papers.

Every table – small work place that useful for owner. I want make it for someone.

Table for me will be great thing that I use for my own environment. I want make it better and smarter.

I think that demand is on. That nice place for being like small design business, it is some kind of good practice.

I have about 30 different upgrades in notes for different furniture and I want to make in real all of it.

I have a lot of practice in work with materials and I like it, I want to have practice in it more than I have now.

My calculations equal for 5 000 \$ to start business for first 12 weeks. After it may be about 100-500 \$ for 2 or 3 products. Find first clients about 100-500 \$. For one product spend about 1 week and after faster because you may create your own hints or patterns.

I think that first sale may be around 6-8 weeks.

If we may calculate some chance it is may be equally to 8 000 – 12 000 \$ to full start. First good sale may after 10th week.

There are some upper collection by this business, because from it I may start a lot of else like IT or Design. Because it is a full production room for everything.

Chair

Comfortable flexible chair.

A deal completely compare with table. I think there are mixture and combining handmade chair with handmade table. There are different special functions that I think extremely needed to be in this product. Table needs to be useful and smart; chair needs to be comfortable and flexible.

May be this business might work only 3 months and I will sell it with benefit but I have after all good experience from this discipline.

My task in chairs is make something anatomy-based and make simple design from few parts. I want to make chair that will be smarter in adaptability that may contain work task and psychology of using.

There are may be cost to 200-500 \$ per one product only because it will be hard to create from steel. I want to make benefit more in experience than money. Money may help me do it again.

For first several products I may spend about 3 weeks to create 1 chair because there are different works with iron. This is only combining with business from tables. Cause it is combine products. There are also around 1000 to 5000 \$ to start it.

At the result of chance 1200 to 6100 may be. And about 21-24 days to do 1 chair.

Chair

Comfortable flexible chair.

There is a deal that completely compare with table. I think there are mixture and combining handmade chair with handmade table. There are different special functions that I think extremely needed to this product. Table needs to be useful and smart; chair needs to be comfortable and flexible.

My target to create something perfect and have experience and abilities in this kind of work. to make it no better than everyone. But I want to do it perfectly with things that I know because interests a lot of complex. I may think about psychology, design and not at all technologies, that may be contained in one product. Product may be perfect in different ways, but I want to make better in all-around ways and not in one. I create a hand-made product that may have engraving and work from wood.

I think this is unique product will be. I can't say that all life I want make this, but I will be happy work in my IT or Design or Government business on my chair and table, that I do by myself. I believe that all time that you spend to do something can't disappear its memory that make all your doings more valuable.

Maybe this business may leave only 3 months and I will sell it with benefit but I have after all experience from this discipline.

My task in chairs is make something really complex in anatomy and make simple design from parts. My task does it great from anatomy and human structure. I want to make chair that will be smarter than others in way of adaptability that may contain work task and psychology of using course with different combining.

I have about 2 schemes that I already create on paper and I will do it. There are not a lot of materials but I think that in the start of being I will use wood, polymers, steel and cotton. There may change in process but I see it something like it, of course I want to make my chair from steel, carbon and red wood. But I see in first stages of being.

There is may be cost to 200-500 \$ per 1 product only because it's hard to create from steel. I will make benefit in experience more than money but money really may help me do it again. For first several products I may spend about 3 weeks to create 1 chair because there are different works with iron. This is only combining with business from tables. Cause it's one to one product. There are also around 1000 to 5000 \$ to start it.

At the result of chance 1200 to 6100 may be. And about 21-24 days to do 1 chair.
