

Researcher / Developer

65\$ / hour

Researcher

I think, that I am completely similar <sup>with</sup> to researcher because I always try to research something and <sup>find</sup> make from it useful information, that I may use in future for something.

I think that researcher's task is <sup>not</sup> to read information and parse all of it. Yes, it is too, but less than find target for information. I think that researcher <sup>must</sup> may use information like instrument that may create something. <sup>new</sup>

I cannot said that I worked before officially like researcher. However, I know technique, and may teach someone. I do a lot of this for myself and create <sup>unique</sup> technique to <sup>do</sup> make it better. System and organization in researching process.

Developer

May be I do not qualified a lot. Nevertheless, I think that I have possibilities to develop something using my own technical task and <sup>do</sup> may it not bad. I want to develop, because a lot of my project contain these tasks.

My resume have some works like developer of software. I work like junior game developer at 2014 year on out source in company Byka. This is no longer than 1-month work because <sup>they need it</sup> I think they do not pay me at least. I understand that it is only experience and it is interesting for me. After this, I do not work more in game developing, but I want to do it with sense in future. <sup>pay me</sup>

I <sup>try</sup> to work like small software developer for myself, taking simple tasks from internet in 2016 year. It is funny and there are many boring works. My task was not to make more money. Most of all I want to have new experience.

At all of all I think I will be useful in this two types of profession. I may develop well on Java, C++, Python, Ruby and Flash. Try bad not a lot on IOs, Android and Perl. If I have possibilities to study, more code types. I really want to do it, because <sup>this excite me</sup> there is exciting for me.

In addition, I work a lot for Web-development and here I know a lot more, because my project in most of interest <sup>be</sup> site engineering. I know HTML, CSS, JS (+additional systems), PHP, MySQL. Of course, sometimes my customer said me to make from internet platforms, like Ucoz, WP, Drupal, Joomla, Prestashop, Dolphin, MODx.

Seriously, I cannot count how much sites or programs I <sup>write</sup> create. I lose all of my internet services from 2007 year and I refresh all of it. Now I cannot count all of my orders, I can only guess how much there are interesting projects I really remember and want to describe them in future but most of all - boring.

My prediction about 500 sites and about 36-39 % of them makes on code. I take many platform orders, because in Russia I may find clients faster. Around 100-120 software programs, in the most of all there are small platforms for small businesses. Like there are connection between bases, that I need to create too. In the end of childhood, I make launchers for some game's projects for my own.

To my own surprise, I have possibility to work in hardware development in factory. I have been Junior Developer and work as assistant. We need to make program for manufacturing. I cannot work here for a long time because there are bad politics of factory and I cannot make good relations with my adviser/mentor. They pay me only half of all money and there are less than 100\$. I work during 15 days 3 weeks. Moreover, spend about 60\$ only for transport to work.
