

Engineering

I like design technique. I make it with full interest. I have a small habit or hobby. I disassemble technique to single-parts. Try to rewrite the plate, connections and devices. Critic all of I see for myself on the paper, I think I do it to do not make ~~the~~ mistakes in my future creating.

I really like mechanisms, but I cannot work in this profession without education ~~in this~~ discipline. In addition, no one hear me first several years and I think that I need do it from myself like company.

Full of my life I like to disassemble and assemble my computers. I like to create small plates for some practice in 2013 – 2016 years. My life from 4 years full of technologies and every day any time I like to research them.

I completely like design and psychology. I think this is the most important adaptive disciplines that need to know good engineer. For example of it I will take a car. Car needs to be beautiful and comfortable. Beautiful – design, comfortable – placement in mind of owner (psychology).

I can't said take me to order, I know nothing in practice with the exception of plates, connections, voltages, wires, materials, characteristics, color eye-detection, system of architecture, complementation, resistance, norms & rules of government and something more that I can't describe in moment fully. In addition, I know about psychology of forms and watch through perfect forms & numbers; design for me the life that do us simpler to make us more complicated.

In the end of this description, I want to say that I want to know more and more in this discipline. For in I need practice and I will be happy to be part of something great.
