
Phone

This change psychology of phones.

I want to make more smart for reality because now we have only phones like their own digital environment. I want to combine real and digital to make efficient owner. They may have a lot of possibilities and knowledge about yourself only by phone.

I want to make phones more protected from other on mechanic level. This needs in our world because all of us needs to know about yourself more than others.

Phone now is part of life everyone and I want to make it more better. Only "more" because I may calculate this to show for clients. They need to understand different to buy something new.

I want to remove zombie users and create homo deus from simple gadget. I think that everyone needs to have small gadget that comfortable, useful and create from you something more. Often in phones we can't create different between targets for your own or we have few time to use it without charging. I solve this problem because think in another way.

I really like paper and something like material things. Now I think about different ways to make phone more material, not like a kind of product constant form.

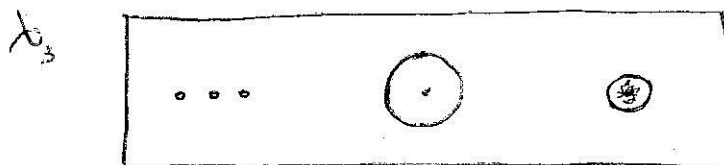

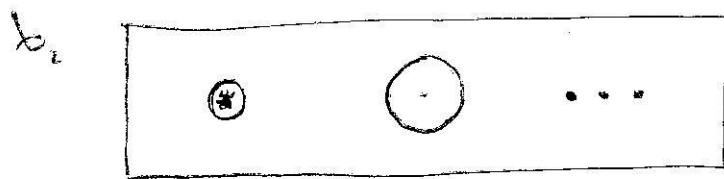

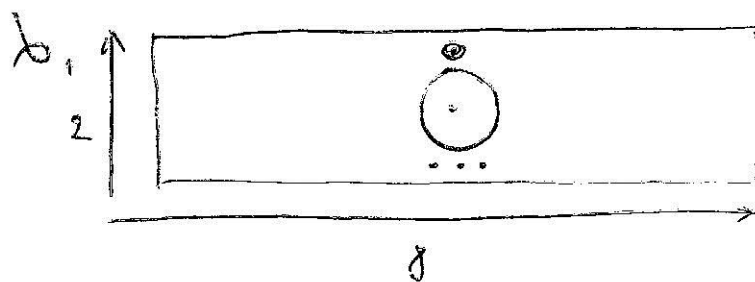

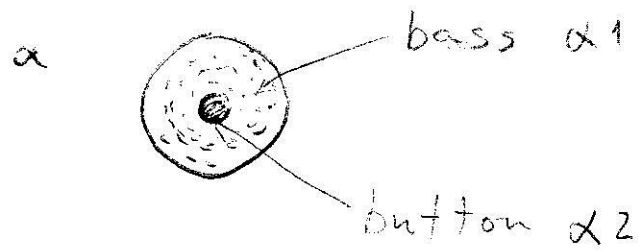

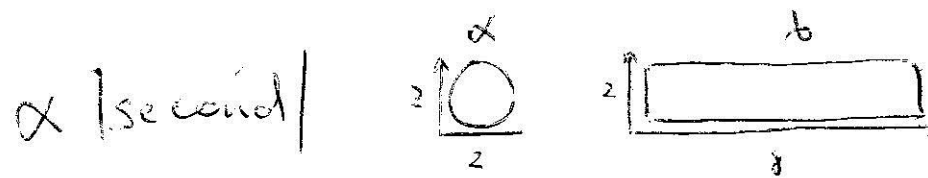

I can't create an plan of these for problem of copy. I want to make it step-by-step from camera to full gadget. I need to study processes in matrix algorithms and different specific of AI and camera comparing.

My average cost of these prototype is 50 000 to 2 000 000 \$. Also plus 30-40% for human bad value. It's 65 000 – 3 300 000 \$.

From 47 to 210 weeks to these project and in the result 61 – 294 weeks.

Here the most expensive technologies is hold screen, artificial intelligence of camera, placing of technique and power transfer because place in the corpus really few.

I said that I do it before 2034 year. Is coming

-  - camera
